SILKWORM GUT AS A SUBCUTANEOUS SUTURE IN CLOSURE OF ABDOMINAL INCISIONS.¹

BY

THOMAS S. CULLEN, M.B. TOR.,

Resident Gynecologist, Johns Hopkins Hospital; Instructor in Gynecology,
Johns Hopkins University.

IN March of this year Dr. Harvey, of Troy, when visiting us, suggested the use of silkworm gut as a subcutaneous suture instead of silver wire or catgut. He told us that Dr. David W. Houston, of Troy, had employed it for some time and was highly pleased with it.

Since March this suture has given such satisfaction that we employ it almost entirely. Heretofore we closed the peritoneum with catgut, the fascia and muscle with mattress sutures of silver wire or silkworm gut, and the skin with subcutaneous catgut. If the walls contained much fat it was deemed advisable to use several catgut sutures to secure accurate approximation, as there was danger of the catgut absorbing before satisfactory union had taken place. Occasionally we employed subcutaneous silver wire, which answered very well.

Our method of closure now is: (a) For the peritoneum, continuous catgut.

(b) For the fascia and muscle, mattress sutures of silver wire or silkworm gut; where the walls are thick and much tension required, usually silver wire; and where the walls are thin, silkworm gut.

(c) Subcutaneous silkworm gut, even though the walls are thick, no fat suture is employed, the adipose surfaces lying loosely one against the other. It may be mentioned that Dr. Halsted has for a long period paid no attention to the fat, merely using the subcutaneous silver wire.

It is advisable to pick out good, strong strands of silkworm

¹ Read before the Clinical Society of Baltimore, May, 1897, when nine patients closed by this method were exhibited.

CULLEN: SILKWORM GUT AS A SUBCUTANEOUS

Name.	Date.	Nature of operation.	Thickness of abdominal wall.	Layers of sutures.	When removed.	Difficulty.	Result.	Remarks.
S. McC.	March 31st, 1897.	Myomectomy.....	Thick	Twenty-fifth day.	None	Perfect.	
A. H.	April 4th, 1897.	Hystero-myomectomy.....	"	Twenty-first day.	"	
E. W.	April 12th, 1897.	Nephorrhaphy.....	Thin	Twenty-first day.	"	
C. S.	April 19th, 1897.	Breaking up pelvic adhesions; suspension of uterus.	(a) Catgut, (b) silver wire, (c) subcutaneous silkworm gut.	Stitch broke off and could not be removed.	
B. P.	April 23d, 1897.	Suspension of uterus.....	(a) Catgut, (b) silkworm gut, (c) subcutaneous silkworm gut.	Eighteenth day.	"	
S. P.	May 19th, 1897.	Appendectomy.....	Thick	(a) Catgut, (b) silver wire and catgut, (c) subcutaneous silkworm gut.	About twenty-fifth day.	None	"	
F. E.	April 19th, 1897.	Hysterectomy.....	Moderate	(a) Catgut, (b) silver wire, (c) subcutaneous silkworm gut.	About twenty-fifth day.	"	"	
J. W. W.	May 15th, 1897.	Myomectomy and suspension of uterus.	Thick.....	(a) Catgut, (b) catgut, (c) subcutaneous silkworm gut.	About twenty-fifth day.	"	"	
G. H.	May 12th, 1897.	Myomectomy; suspension of uterus.	"	(a) Catgut, (b) catgut, (c) silkworm gut.	About twenty-fifth day.	"	"	
S. B. T.	May 10th, 1897.	Hystero-myomectomy.....	"	(a) Catgut, (b) silver wire, (c) subcutaneous silkworm gut.	About twenty-fifth day.	"	"	
R. A.	May 28th, 1897.	Nephorrhaphy and suspension of uterus.	Thin	(a) Catgut, (b) silver wire, (c) subcutaneous silkworm gut.	About nine-tenth day.	"	"	
B. S.	May 24th, 1897.	Hystero-myomectomy.....	"	(a) Catgut, (b) silver wire, (c) silkworm gut.	An attempt was made to remove on twenty-fifth day, but unsuccessful, as suture broke off.	None	
F. R.	MAY 17th, 1897.	Suspension of uterus.....	Moderate	(a) Catgut, (b) silver wire, (c) silk-worm gut.	Twenty-fifth day.	"	
K. D.	May 14th, 1897.	Removal of parovarian cyst.	"	(a) Catgut, (b) silver wire, (c) silk-worm gut.	Ends broke off ..	Fair,	
A. D.	April 21st, 1897.	Repair of perineum; suspension of uterus.	"	(a) Catgut, (b) silver wire, (c) subcutaneous silkworm gut.		
A. W.	May 14th, 1897.	Removal of left tubo-ovarian mass.	"	(a) catgut, (b) silver wire, (c) subcutaneous silkworm gut.	Twenty-third day.	"	Perfect.	

There was a kink, evidently due to one loop of ligature being caught by the next. Abdominal incision broke down and a large quantity of pus escaped; evidently some infection down near the muscle.

SUTURE IN CLOSURE OF ABDOMINAL INCISIONS.

gut, and where the incision is long a new strand should be inserted every six or seven centimetres; the ends are then tied together.

Advantages.—This suture is very pliable, does not kink, and if good will not break. It may be left in place one month, or more if desired, and causes little or no irritation.

Disadvantage.—It is occasionally so firmly embedded in the tissues that it will break off.

The Removal of the Continuous Suture.—It may be looked at about the tenth day, and, if union be satisfactory, removed; if desirable it may be left much longer. Where the suture is short it can often be removed by the slightest traction; if the incision be a long one the knots where the sutures join are cut and firm and steady traction is made with a pair of artery forceps. Should the silkworm gut break off beneath the skin the remaining piece is left behind, as is the case when silver wire breaks.

The accompanying is a synopsis of thirty-eight cases, operated upon by Dr. Kelly and myself since March, where subcutaneous silkworm gut was employed.

From a perusal of these cases it will be seen that in two a knot had been formed which prevented the removal of the suture. Here the needle had retraced its steps, catching in the loop that had just been formed. Such a mistake is easily avoided after one has once been put on his guard. In four cases the sutures broke; this fault we have overcome by making the sutures shorter where the incision is long, employing two or even three sutures instead of one long one.

Dr. Houston has employed this method of closure since May, 1895, using it not only in abdominal surgery, but also in all kinds of operative work. He finds it especially suited to wounds on the face, where very fine strands are employed, and can be removed at the end of forty-eight hours or longer.

At the meeting of the Society Dr. J. W. Williams said that he had used this method in closing the abdomen for one and a half years and was thoroughly satisfied with it. Whether this suture has been adopted or not by others we cannot say, but it is one that may well be utilized by the profession at large.
